

CYCLEX NETWORK · WHITEPAPER V4.0

Security that starts before the loss.

CycleX Network is a Web3 security ecosystem that shows users what a token, a contract or a wallet permission can really do, before they sign, buy or connect. Evidence first, verified on-chain, with unknowns always reported as unknown.

TOTAL SUPPLY

99B

99,000,000,000 CYCX · fixed

PUBLIC FLOAT

100M

The only circulating tokens

CONTRACT TREASURY

98.9B

Held by the token contract

CYCX CONTRACT · BNB SMART CHAIN (BEP-20)

0xda63b65825AE30532a507B0C091B0bD9F8204F7E

A proactive security layer for everyday Web3 users

Most losses in Web3 are not dramatic hacks. They come from tokens that cannot be sold, taxes hidden in a contract, forgotten wallet approvals and transactions whose real effect was never clear. Users usually discover the risk only after the damage is done.

CycleX Network changes that order. Its tools read the blockchain directly, simulate what would happen before anything is signed, and present the result in plain language, with every figure either verified on-chain or clearly marked as unverified.

The ecosystem has two layers:

- **The product layer:** Security Hub (Quick Scan and Deep Intelligence), the CycleX Network Scanner Bot on Telegram, the Firewall with Wallet Watch, and the Developer API.
- **The access layer:** CYCX, the token that unlocks advanced features and aligns long-term participants through a transparent, quarterly reward cycle.

The firewall is the product. The token is the access key. CycleX Network is built as a working security platform first. The token sits behind the product, not in place of it.

Users are rarely hacked. They are left exposed.

Risk builds up quietly, through details that normal interfaces do not show:

Hidden token behavior

Honeypots that block selling, taxes that can reach most of a trade, owners who can mint, pause or blacklist. None of it is visible on a price chart.

Invisible permissions

Token approvals stay active long after a trade. A single compromised spender can drain every token it was allowed to move.

Unclear signatures

Transaction prompts rarely show real intent. Users approve calls they cannot read, on networks they cannot verify.

Most scanners answer these questions with a single score. When data is missing, many of them quietly treat it as safe. CycleX Network is built on the opposite rule: **a result is only as strong as the evidence behind it**, and missing evidence is shown as missing.

Four products. One security network.

A. Security Hub LIVE

A multi-chain scanner on cyclex.network covering 12 networks, including BNB Smart Chain, Ethereum, Base, Arbitrum, Polygon, Optimism, Avalanche and Solana. No wallet connection is needed.

Quick Scan

- Contract controls: owner, mint, pause, blacklist, proxy and upgradeability
- Liquidity, pools and LP lock / burn evidence
- Holder concentration and market structure
- Results in seconds, in four languages

Deep Intelligence

- **Real buy and sell simulation** through the token's own DEX router: detects honeypots and measures buy, sell and transfer tax
- Deployer history, including earlier tokens scanned by CycleX Network
- Early buyers, immediate-launch activity and shared-funding wallets
- LP lock expiry, ownership and upgrade history

The Security Hub also includes a **Tx Decoder**, which turns a transaction into a readable preview before it is signed, and an **RPC Health Checker**, which flags unhealthy or suspicious network endpoints.

B. CycleX Network Scanner Bot LIVE

The same scanning engine inside Telegram. Paste a contract address and receive a structured security report across 12 networks, with an overall score, contract risks, liquidity on DEX and centralized venues, holder analysis and **Exit Path**: an estimate of how much can realistically be sold through the available pools. Every figure verified directly on-chain is marked as such.

C. CycleX Network Firewall LIVE

Blast Radius

Maps every active token approval and the value each spender could move.

Fix Mode

A clear path to revoke dangerous permissions, starting with the highest exposure.

Wallet Watch

Live monitoring that alerts in the browser when a new approval appears on a watched wallet.

Wallet Passport

A cryptographically signed, wallet-bound security record that reflects the wallet's security posture.

D. CycleX Network Developer API LIVE

Programmatic access to CycleX Network monitoring for wallets, exchanges, bots and security teams: asset monitoring, security events, incidents and webhook delivery.

ITEM	DETAILS
Base URL	<code>https://cyclex.network/api</code>
Authentication	Authorization: Bearer <code><API_KEY></code> · every plan, including Free, uses an API key
Service status	<code>GET /v1/health</code>
Asset monitoring	<code>GET /v1/monitoring/assets/:chain/:token/events</code> <code>GET /v1/monitoring/assets/:chain/:token/incidents</code>
Feeds	<code>GET /v1/events</code> · <code>GET /v1/incidents</code>
Watchlists	<code>/v1/watchlists</code>
Webhooks	<code>GET /v1/webhooks</code> · <code>POST /v1/webhooks</code>
Usage	<code>GET /v1/usage</code> (does not count toward quota)

PLAN	API CALLS / MONTH	HISTORY RETENTION
Free	10,000	7 days · Global Intelligence preview
Starter	50,000	30 days · full Global Intelligence
Growth	250,000	60 days
Pro	1,000,000	90 days
Enterprise	Custom	Custom

Only authenticated customer calls count toward the monthly quota. Dashboard traffic and internal webhook processing do not. When a quota is used up the API returns `api_call_limit_reached`. The monthly plan quota is enforced. No public per-second rate limit is currently documented.

Evidence over claims

Every CycleX Network product follows the same reporting rules. They are what make a result trustworthy, and what separate a security tool from a score generator.

Unknown is never shown as clean

If a data source fails or coverage is incomplete, the report says so and explains why. A missing value is never displayed as zero, "none" or "safe".

On-chain verification is marked

Figures read directly from the blockchain are labeled as verified. Figures from third-party providers are labeled by source.

Simulations never touch real funds

Buy, sell and transfer tests run as read-only simulations. Nothing is broadcast, nothing is signed, and no user funds are involved.

Context, not accusations

Signals such as a fresh deployer wallet or shared funding are presented as evidence to review, with the reasoning shown, not as proof of intent.

Client-side inspection, protected evaluation, on-chain rules

- **In the browser:** scans read public blockchain data. Users never share seed phrases, and scanning never requires a wallet connection.
- **Protected services:** heavier analysis (Deep Intelligence, simulations, the API) runs on protected server infrastructure. Provider keys stay server-side and are never shipped to the browser.
- **On-chain:** the CYCX contract enforces the token supply, the treasury balance, and every reward claim.

Basic tools stay broadly accessible, because a safer Web3 benefits everyone. Advanced capabilities are tied to the access layer.

CYCX: the access key

CYCX is a BEP-20 token on BNB Smart Chain. Holding **at least 100 CYCX or 1 PASS** unlocks advanced Firewall capabilities and enhanced monitoring as the ecosystem expands. CYCX is also the basis of the quarterly reward cycle described below.

CYCX has not launched yet. The launch date and the reward-cycle schedule will be announced only through the official CycleX Network channels. Anyone offering CYCX before an official announcement is not affiliated with the project.

07 · THE REWARD CYCLE

A quarterly cycle built for long-term self-custody

CycleX Network runs a quarterly reward cycle for eligible holders. It is a protocol mechanism with published rules, not a guaranteed return.

RULE	DETAILS
Target reward	9% per cycle to eligible holders. The 9% is a target computed by the published policy, not a fixed on-chain guarantee.
Schedule	After launch, cycles run at the end of March, June, September and December.
Eligibility	At least 60 consecutive days of holding in a self-custody wallet. Exchange balances do not qualify, because users do not control exchange addresses.
Holding age (FIFO)	Holdings are tracked in lots. When tokens are transferred or sold, the oldest lots leave first . Selling part of a position therefore removes the most mature holding time first.
Claiming	Each holder claims for their own wallet with a Merkle proof and pays their own gas. One claim per wallet per cycle.
Unclaimed rewards	Do not roll over to the holder. Each cycle must be claimed within that cycle. Unclaimed amounts stay in the contract treasury.

Where every token comes from

All three flows of a cycle are paid from the contract treasury. **Holders' rewards are never reduced to fund the other two.**

TREASURY Source of all flows 98.9B CYCX held by the contract	1.0 CYCX Holders The full reward, claimed by eligible holders	+ 1.0 CYCX Burn Destroyed permanently, 1:1 with the reward	+ 0.2 CYCX Development & Operations 20% of the reward, paid in addition, never deducted from it
--	---	--	---

Example: for every 1 CYCX that holders receive, the treasury also burns 1 CYCX and sends 0.2 CYCX to Development & Operations. The holder still receives the full 1 CYCX. The Development & Operations allocation funds audits, infrastructure, security research and ecosystem growth.

How a cycle is executed

Eligibility and amounts are computed off-chain by the published policy (holding period, FIFO lots, exclusions). The result is committed on-chain as a Merkle root together with the cycle total. From that point the contract enforces the rules itself:

- the treasury must hold enough for the reward, the burn and the Development & Operations allocation, or the cycle cannot start.
- total claims in a cycle can never exceed the committed total.
- each wallet can claim only for itself, and only once per cycle.

Cycle transparency. Every cycle start is recorded on-chain (Merkle root, reward total, amount burned, Development & Operations amount). In addition, CycleX Network publishes the number of eligible wallets and the snapshot block for each cycle through its official channels.

08 · TOKENOMICS

Fixed supply. One public float. A contract-held treasury.

COMPONENT	AMOUNT	DETAILS
Total supply	99,000,000,000	Created once at deployment. The contract has no mint function . The supply can only decrease through burns.
Public float	100,000,000	The only tokens that will circulate at launch, allocated to public distribution and liquidity. The exact split will be published before launch.
Contract treasury	98,900,000,000	Held by the token contract itself, not by a team wallet. It funds reward cycles, burns and the Development & Operations allocation.
Team / investors	None	No team allocation, no investor allocation, no vesting schedule.

The Development & Operations allocation exists only as the additional 20% of each cycle, paid from the treasury. It never comes from holders or from the public float.

What the contract can and cannot do

A security project should be held to the same standard it applies to others. These are the facts of the CYCX contract, as any scanner, including our own, will report them.

PROPERTY	STATUS
Contract address (BNB Smart Chain)	0xda63b65825AE30532a507B0C091B0bD9F8204F7E
Built on	OpenZeppelin v5 (ERC-20, Ownable, Pausable, MerkleProof)
Upgradeable / proxy	No. The code cannot be replaced.
Mint after deployment	No. Supply is fixed at 99B and can only go down.
Buy / sell / transfer tax	None.
Blacklist or per-wallet blocking	None.
Emergency pause	Yes. The owner can pause all token transfers, including trading and claims, as an emergency control.
Reward cycles	Started by the owner, who commits the Merkle root and cycle total. The 9% target is applied off-chain by the published policy. The contract enforces the treasury balance, the per-cycle cap and one claim per wallet.
Access to holders' wallets	None. No one can move tokens out of a holder's wallet.

We publish these powers openly instead of hiding them behind vague wording. Every owner action is recorded on-chain and can be checked by anyone.

A finite treasury, managed in the open

Each cycle uses 2.2 CYCX from the treasury for every 1 CYCX paid to holders (1.0 reward + 1.0 burn + 0.2 Development & Operations). The treasury is therefore finite and shrinks over time, while the burn permanently reduces total supply. The contract refuses to start any cycle the treasury cannot fully cover. The current treasury balance and all cumulative totals (claimed, burned, allocated) can be read directly from the contract at any time.

Continuity plan. When the treasury approaches depletion, CycleX Network will introduce a successor token with a simple, fast migration path, designed so that no holder loses their position in the process. The migration terms will be published in advance through the official channels.

Official channels and anti-scam rules

- **Admins will never message you first.** Treat every unsolicited direct message as a scam.
- **Never share a seed phrase or private key**, with anyone, for any reason. No CycleX Network product will ever ask for one.
- There are no manual claims, "support fixes" or private airdrops. Claims happen only through the official interface, from your own wallet.
- Before launch, **no one can sell you CYCX**. Only announcements in the official CycleX Network channels are valid.
- Always verify the domain **cyclex.network** and the contract address before connecting a wallet.
- Use a hardware wallet for long-term holdings, and review every transaction before signing.

If anything is unclear, do not connect the wallet and do not sign.

A security project in a high-risk environment

CycleX Network is a utility-based Web3 ecosystem. Nothing in this document is financial, investment, legal or tax advice, and nothing in it is a promise of profit or return. Rewards depend on eligibility, protocol rules, contract execution and treasury balance, and are not guaranteed.

- **Market risk:** token prices can be highly volatile.
- **Smart-contract risk:** despite review, contracts can contain errors or behave unexpectedly.
- **Administrative risk:** the contract owner holds the powers described in Section 9, including the emergency pause and the start of reward cycles.
- **Treasury risk:** the treasury is finite. Long-term rewards depend on its remaining balance. A successor token and migration path are planned for when it approaches depletion (Section 10).
- **Network risk:** congestion, forks, RPC failures or chain-level issues can affect access.
- **Operational risk:** website, provider or third-party outages can limit access to tools. The contract and its rules remain on-chain regardless.
- **Analysis limits:** security scans reduce risk but cannot eliminate it. A clean result is not a guarantee of safety.
- **Regulatory risk:** laws and their interpretation can change. Users are responsible for complying with the rules that apply to them.

Web3 security should begin before the loss, not after it.

The firewall is the product. The token is the access key. · cyclex.network
